

Term 4

Are we alone? The search for planets beyond our solar system

DETAILS

Earth is the only place we know of that supports life. It is special because it is covered in water, which exists in liquid form due to Earth lying in the 'Goldilocks Zone', orbiting our star, the Sun, at just the right distance; it is neither too hot nor too cold. But could there be another 'Earth' somewhere in the vastness of space, orbiting its own star, with conditions that could support life?

In this course, you are encouraged to take an investigative and hands-on approach and working scientifically. You will learn about the wide variety of space related careers the space industry can offer. Are you ready to explore extra-terrestrial life?

WHAT TO BRING

All students should bring in recess and lunch, a water bottle and hat.
